PATENT 09/849,022 Docket 091/005

## CLAIM AMENDMENTS

Please Do Not

Enter. 6.2.05 TNT

- 1. (Previously presented) A method for producing a population of genetically altered human embryonic stem (hES) cells, comprising:
  - a) obtaining a population of hES cells essentially free of feeder cells; and
  - b) transfecting the cells with a polynucleotide while being cultured on an extracellular matrix in a medium conditioned by fibroblast feeder cells, wherein the polynucleotide comprises a protein encoding region operably linked to a promoter that promotes transcription of the encoding region while the cells are undifferentiated,

thereby producing genetically altered hES cells that express the protein while undifferentiated.

- 2. (Original) The method of claim 1, further comprising preferentially selecting cells that have been genetically altered with the polynucleotide.
- (Previously presented) The method of claim 1, wherein the human embryonic stem cells are
  maintained in an environment comprising extracellular matrix components and a conditioned
  medium produced by collecting medium from a culture of feeder cells.

## 4 & 5. CANCELLED

(Previously presented) The method of claim 1, wherein the polynucleotide is selected from an adenoviral vector, a retroviral vector, and a DNA plasmid complexed with positively charged lipid.

## 7. CANCELLED

- 8. (Currently amended) A cell population comprising undifferentiated human embryonic stem (hES) cells <u>cultured</u> on an extracellular matrix in a medium conditioned by fibroblast feeder cells.
  - wherein the population comprises calls expressing a protein from a heterologous polynucleotide in which an encoding region for the expressed protein is operably linked to a promoter that promotes transcription of the encoding region while the hES cells are undifferentiated.
- (Currently amended) A cell population comprising undifferentiated hES cells <u>cultured on an</u> <u>extracellular matrix in a medium conditioned by fibroblast feeder cells.</u>
